

How to Develop an App in Android Studio

This document grew from a final project in Web Development II where we had to build an android app in android studio by completing an online course.

Afterwards, I needed to create a final project for my Technical Communication writing course and I decided to document part of the Android Studio process.

This project was challenging but rewarding. There was so much information to explain that at times, it became difficult to know which information was relevant or which information was over-simplified or over-complicated or extraneous.

When this happened I found it helpful to remember my target audience and to stick to my goal of giving a beginner enough information to create a simple app.

I think I achieved this goal. The information in this document covers the use of Android Studio, XML, and connecting an Android device. I included diagrams and screenshots to help the reader as much as possible and tried to keep my language simple and direct.
